The buffer restrictions shown on the above map are outlined in the Stormwater Management Rule (N.J.A.C. 7:8), the Flood Hazard Area Control Act rule (N.J.A.C. 7:13), and the proposed amendments to the Surface Water Quality Standards rule (N.J.A.C. 7:9B),

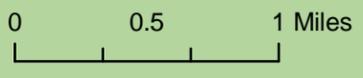

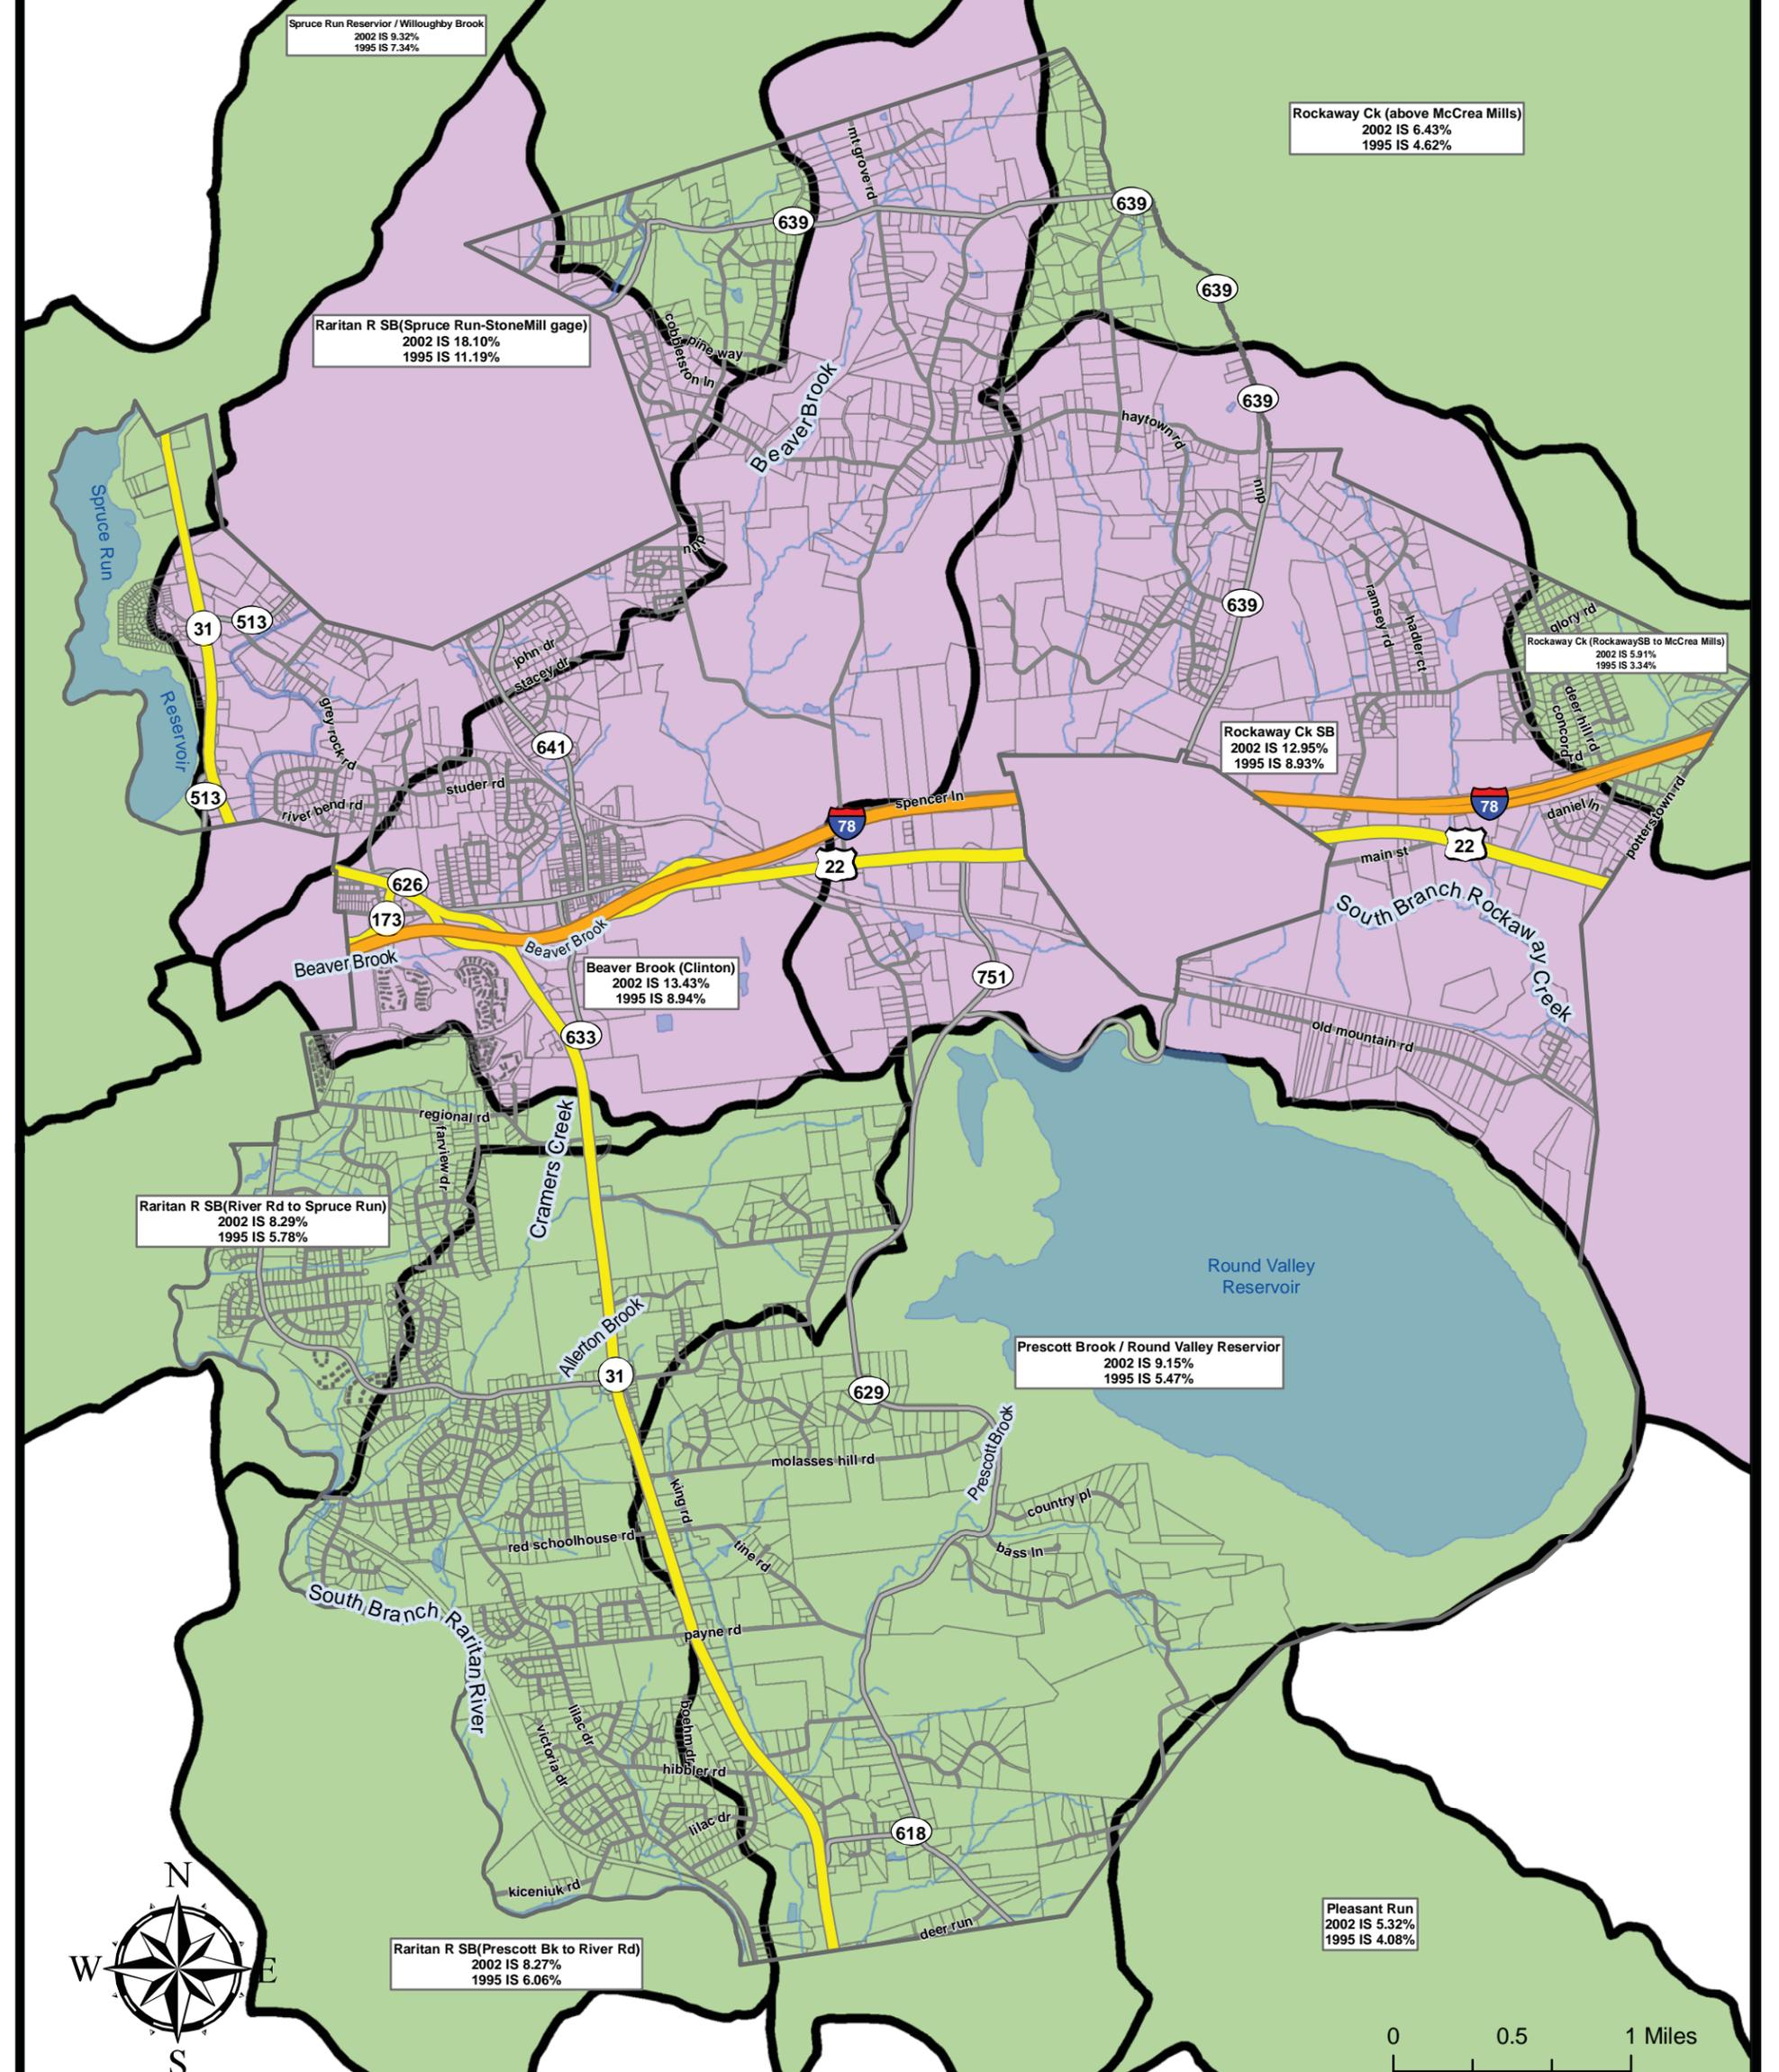

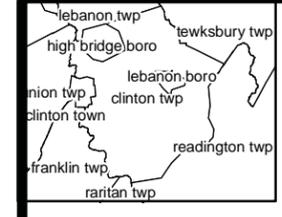

As a result of the Highlands Water Protection and Planning Act, all water courses in the Highlands Preservation Area have 300 foot buffers.

Clinton Township

Natural Resources Inventory HUC 14 Impervious Surface

The first step in creating HUC14 impervious surface layer was to code the HUC14 sub-watershed polygons with some additional attributes. The HUC14 layer was merged with the 2002 LU/LC layer so that the mean impervious surface percent of each HUC14 basin could be calculated. The LU/LC layer includes an estimate of the impervious surface percentage of each polygon mapped in that layer. Using this value, a mean impervious surface percentage could be calculated for each sub-watershed mapped in the HUC14 layer. Once the mean value was calculated, all HUC14 basins with a value of less than 10%, could be identified, and coded as such.

Clinton Township Natural Resources Inventory Highlands Maps Narrative

This narrative is intended for clarifying maps within the NRI and reference should always be made to the Highlands Water Protection and Planning Act and the Highlands Regional Master Plan when making decisions regarding Township business, regulated activities, etc.

The Highlands Regional Master Plan sets forth policies, regulations, and standards for the region. While still in draft form, the Plan and its contents will fully apply when the plan is formally adopted. This narrative reflects the draft Plan stipulations.

Clinton Township Highlands Map:

The Highlands Water Planning and Protection Act designated all lands within the region into one of two areas. The Preservation Area was established to protect the most sensitive natural resources and all policies and regulations developed through the legislation apply to properties within the Preservation Area. The Planning Area contains resources of importance but the policies and regulations do not apply unless the municipality chooses to opt in to the Highlands Regional Master Plan which is due to be released the summer of 2008. According to the map, Clinton Township is primarily located within the Planning Area with only small portions of Preservation Area in the north.

Highlands Boundary Map:

This map depicts Clinton Township alone and shows the land area subject to the regulations of the Preservation Area as well as the fact that the rest of the township resides in the Planning Area.

Land Use Capability Zone Map:

The Highlands Regional Master Plan designated three zones based on the quality and type of resources located in the area. The Conservation Zone, Planned Community Zone, and the Protection Zone contain all the lands in the region and overlay the previously designated Preservation and Planning Areas. The Highlands Regional Master Plan sets forth policies and regulations that apply to each zone and are intended to sufficiently protect natural resources and manage growth according to the capacity of the lands within the zone.

While the Protection Zone regulates activities and restricts development to prevent degradation of the most critical resources in the region, the Conservation Zone policies encourage agricultural production and protection of the farming industry. The Existing Communities Zone reflects those areas with significant existing development and is regulated to encourage smart growth. The Plan encourages compact development that maximizes investments in infrastructure and promotes mixed use in these areas.

The three primary zones also include sub-zones which apply to specific communities and characteristics. The Lake Community Zone refers to the unique areas surrounding lakes, and Plan policies reflect the specific issues that need to be addressed in these locales. Similarly, the Conservation Constrained and Existing Community Constrained Zones exhibit characteristics of the Conservation Zone and Existing Community Zone respectively, but they contain critical habitat, steep slopes, or other resource constraints that require more restrictive policies and regulations.

This map shows which lands within Clinton Township are governed by policies and regulations applicable to each of the zones and sub-zones. Please refer to the Highlands Regional Master Plan for specific policies, regulations, and standards set forth for each zone.

Highlands Resource Area Map:

In addition to the previous overlays, the Highlands Regional Master Plan establishes three resource areas to facilitate the planning process by assessing development potential given the need to maintain ecological values in each of these areas. The Agricultural Resource Area, the Forest Resource Area, and the Critical Habitat Area, were defined through scientific evaluations of natural resources in the region. Resource integrity and viability among other factors led to the designation of lands into one of these categories in order to focus protection efforts around defining characteristics of locations. This map shows which resource areas apply to lands within the Township. Please refer to the Highlands Regional Master Plan for the specific goals and objectives identified for each area.

Highlands Prime Ground Water Recharge Map:

The Prime Ground Water Recharge Areas shown on this map represent areas of land responsible for returning at least 40% of the total recharge volume of a subwatershed (HUC 14). The preservation of these areas is critical to maintaining water quality and quantity in the region. The Highlands Regional Master Plan sets forth policies and regulations to minimize degradation to these areas which includes limiting impervious surfaces and development within these locations. This map is most useful when viewed with the Land Use Capability Map as each zone has specific regulations regarding Prime Ground Water Recharge Areas.

Highlands Existing Area Served Map:

As the Highlands Council had to determine water usage and capacity for growth in the region, permitted Public Community Water Systems (PCWS) were evaluated. This map shows the existing areas in Clinton Township that are served potable water through PCWS.

In the Preservation Area, the sewer service areas were retracted to only the locations where utility pipes currently exist, and the Highlands Regional Master Plan aims to avoid allowing service areas that support development that would degrade water quality or exacerbate water deficits. Due to the fact that Highlands regulations restrict the expansion of sewer service, this map is useful in identifying the current extent of sewer infrastructure. The Sanitary Sewer Existing Areas Served layer represents the portions of each parcel that currently have wastewater service provided by a permitted Highlands Domestic Sewerage Facility. The Existing Sewer Service Area depicts the land area that is potentially served by the current facility.

Land Use Capability Map Public Community Systems Map:

Potable water supplies are provided through Public Community Systems. The Highlands Council evaluated the capacity of these systems to assess water usage and better identify areas that can support future growth. While this map shows the available capacity for the systems serving Clinton Township, please note that the data used to quantify these amounts are not the most-up-to-date quantities and therefore likely to suggest that more capacity is available than currently is.

Land Use Capability Map Septic System Yield Map:

The use of septic systems contributes nitrates to the environment that can pollute water resources and threaten human as well as ecological health. While NJ Department of Environmental Protection rules govern nitrate concentrations in the Preservation Area, the Highlands Council needed to address them in the Planning Area. In order to ensure that the potential pollutants are sufficiently diluted, the Highlands Council evaluated the land characteristics in the region and assigned septic system yield by subwatershed (HUC 14) to meet nitrate concentration targets and water quality goals. This map shows the density of septic systems that each subwatershed can support when policies governing the Protection and Conservation zones are applied. Development potential is limited by septic system yield.

Highlands Open Waters Protection Area Map:

The Highlands Regional Master Plan intends to protect water quality by mandating a 300 foot buffer adjacent to all streams and wetlands in the region. This regulation applies only to the Preservation Area unless Clinton Township was to opt in to the Plan in which case all regulations will apply to all streams. This map shows the surface waters of the Township and when viewed with the Highlands Boundary Map reveals which waters are subject to the Highlands regulations.

Land Use Capability Map Water Availability Map:

In order to promote sustainable uses of water supplies in the region, the Highlands Council quantified the water availability in each subwatershed in the region and evaluated water usage as well as ecological needs and reservoir safe yields. The Council

calculated net availability, the amount of water capacity that exceeds the current consumptive and depletive uses as well as the ecological needs of the area. If net availability is positive, it is shown in blue as unconditional availability on the map. If there is a water deficit in the subwatershed, the map identifies these areas in green and additional water use is deemed conditional in the Highlands Regional Master Plan. The amount of conditional availability is determined by policies and regulations that govern zones within the region. In order to allocate water for additional consumptive or depletive uses in deficit areas, the quantity desired must be mitigated at 125% of the new use. Development proposals are directly affected by water availability, and the Plan outlines the procedure for pursuing projects in deficit areas and how mitigation will proceed.

Highlands Slopes Map:

The Highlands Regional Master Plan acknowledges that development on steep slopes degrades water resources by exacerbating erosion and sedimentation while increasing stormwater runoff. For these reasons, the Highlands Council identified steep slopes in the region to improve resource management and developed policies to address the potential issues associated with this terrain. This map depicts the varying degrees of slope in Clinton Township, and the Highlands Regional Master Plan outlines the policies and regulations that apply to each.

Level of site complexity. Based on the Site Remediation Program's 1989 Case Assignment Manual. It is the intent of the Site Remediation Program that remedial levels be determined for the overall degree of contamination at a site recognizing that individual areas of concern may involve remedial B- remedial level associated with emergency response, simple removal activities of contaminants usually no impact to soil or GW.

C1 remedial levels are associated with simple sites one or two contaminants localized to soil and the immediate spill or discharge area.

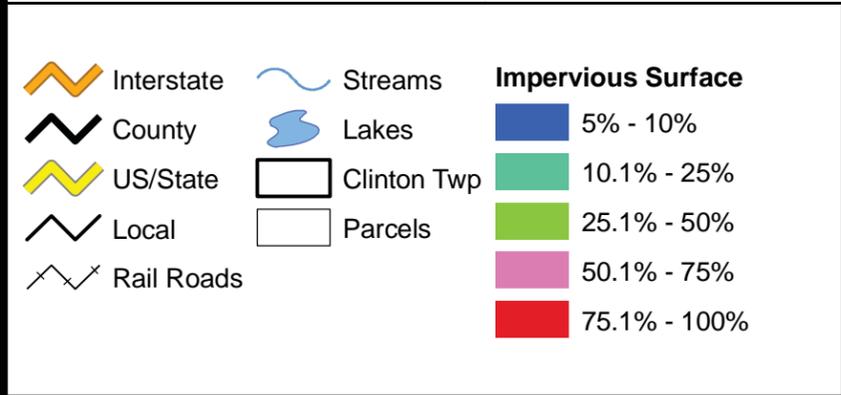

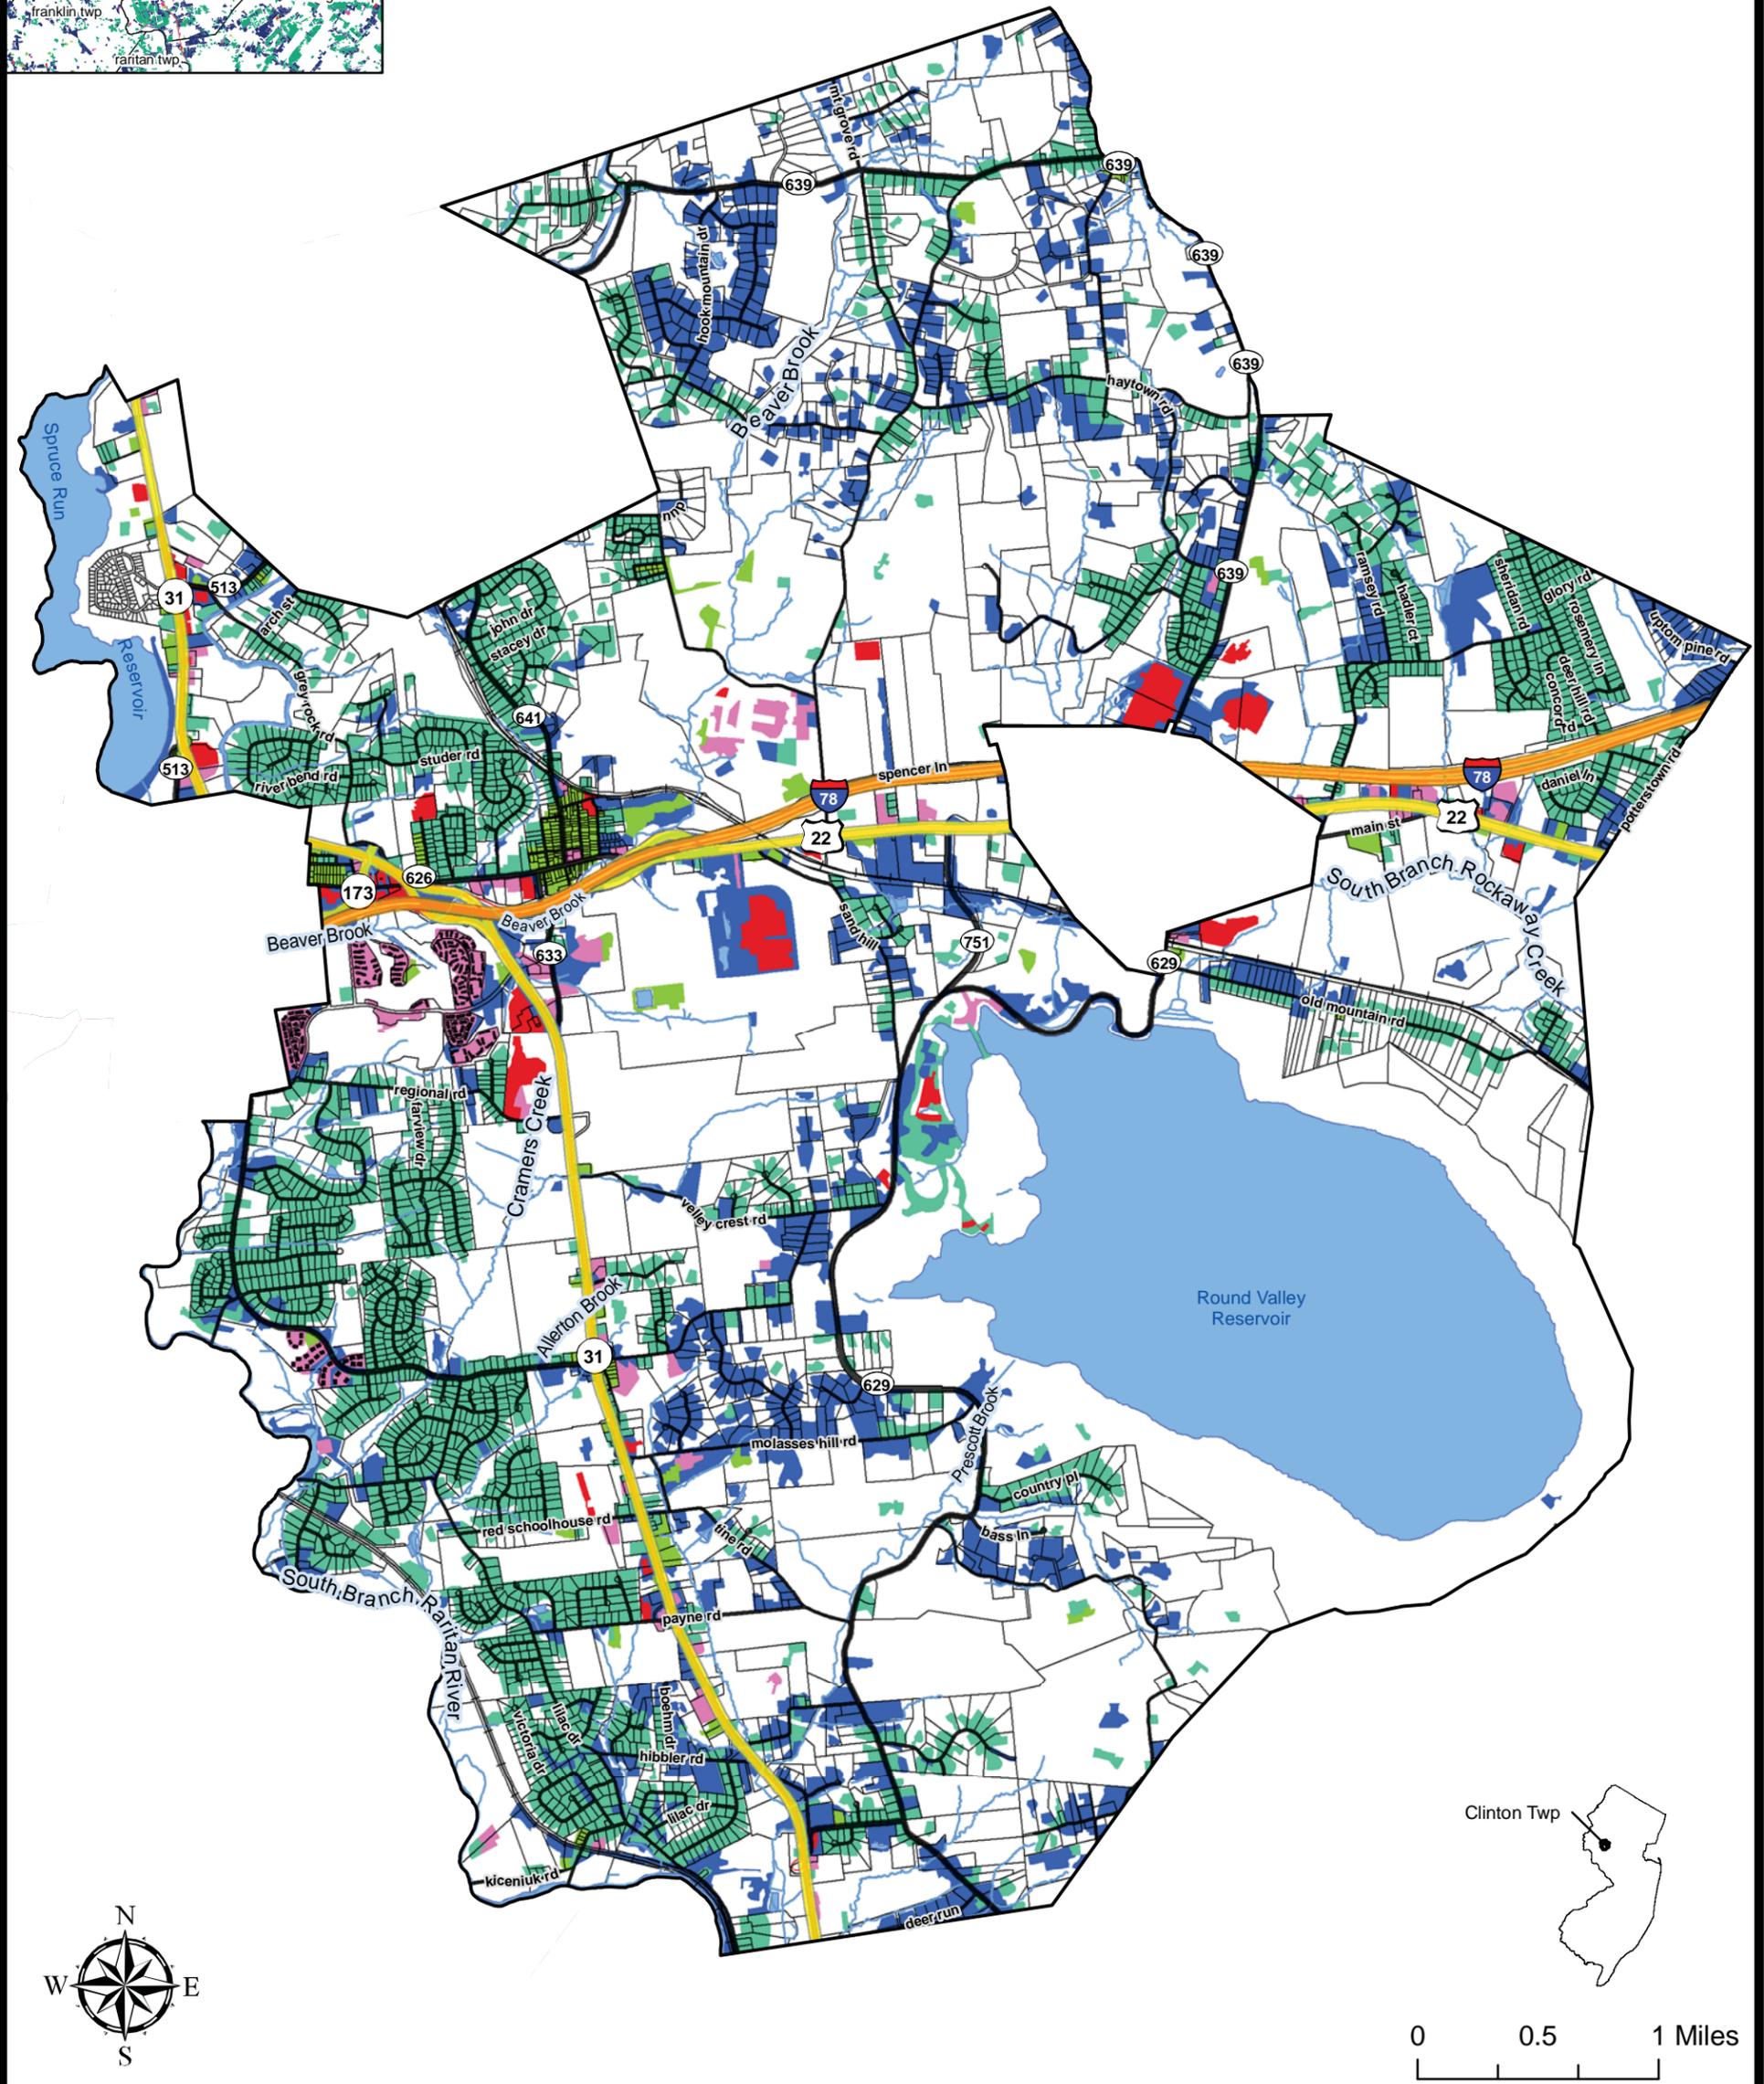

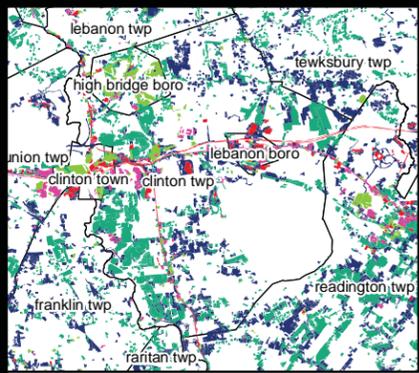

C2 remedial levels are associated with more complicated contaminant discharges, multiple site spills and discharges, more than one contaminant, with both soil and GW impacted or threatened.

C3 remedial levels are associated with high complexity and threatening sites. Multiple contaminants some at high concentrations with unknown sources continuing to impact soils, GW and possibly surface waters and potable water resources. Dangerous for direct contact with contaminated

D- Same conditions as C3 except that D levels are also usually designated Federal "Superfund Sites".

Clinton Township Natural Resources Inventory Summary

A Natural Resources Inventory, also known as an Environmental Resources Inventory, is a collection of information that documents the environmental resources and constraints of an identified region. Through maps and text, the data is portrayed objectively to depict the condition of natural resources and related issues in order to provide a foundation for decision-making. The Natural Resource Inventory can be used as a reference and guide by elected officials, the Environmental Commission, the Planning Board, the Zoning Board, engineers, planners, and other personnel concerned with township issues. The enclosed documents and maps comprise an addendum to Clinton Township's existing Natural Resource Inventory prepared in 2002 and will serve to update current inventory data as well as summarize these additions.

Within the Highlands region of New Jersey, Clinton Township resides in Hunterdon County and contains lands in both the South Branch and Upper Raritan Watersheds. While land use has been greatly influenced by the existence of several major transportation routes within the township, including Route 78, Route 22, and Route 31, the Inventory shows a variety of land use types ranging from rural farmland and forests to dense residential and commercial developments. Due to this diversity of conditions, the use of the Natural Resource Inventory will greatly assist township personnel in assessing appropriate protections and uses of specific locations within the township.

The **2002 Aerial Photographs map** shows the regional landscape including natural cover. The document also depicts water bodies, Hunterdon County parcel data, and improvements such as public roadways and railroads, all of which can be found on each map in the Natural Resource Inventory. The Aerial Photographs map will be updated with 2006 data when it becomes available.

The **Land Use-Land Cover map** elaborates on the information provided in the aerial photographs by categorizing the landscape by its predominant use and characteristics. In addition to the features provided on the Aerial Photographs map, this document distinguishes between agricultural, barren, and urban landscapes while also showing the location of water bodies, wetlands, and forests.

Forested areas followed by other undeveloped natural landscapes best facilitate recharge of groundwater aquifers by absorbing precipitation and runoff at the earth's surface. The **Prime Ground Water Recharge Area map** not surprisingly reflects the forested areas shown on the aerial photos and Land Use-Land Cover maps and identifies those locations within the township that most efficiently provide 40 percent or more of the total recharge volume for the subwatershed.

Prime groundwater recharge areas tend to be associated with areas of low impervious surface cover as such impervious surfaces do not allow water to penetrate to the soils below. The **Impervious Surface map** shows the percentage of impervious cover by land use type calculated from the Land Use-Land Cover data.

When impervious surface percentages exceed 10 percent, subwatersheds, also referred to as HUC 14s due to their identification by a 14 digit Hydrologic Unit Code, experience impairment. The **HUC 14 Impervious Surface map** recognizes the areas within the township that are at risk of impairment due to a mean value for impervious coverage that surpasses this threshold as well as those that have not yet exceeded this measure.

While providing a multitude of benefits, preserved lands can improve groundwater recharge and reduce the negative impacts of runoff associated with high impervious surface coverages. The **Open Space map** complements the previous documents by identifying parcels that have already been protected. These properties have also been categorized by the entity responsible for preserving the property as preservation may serve a variety of purposes depending on the intent of the proprietor or easement holder. More information regarding each open space parcel can be found in the reports identified by the number on the lot.

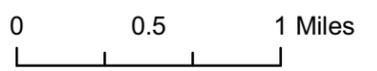

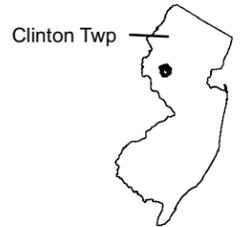

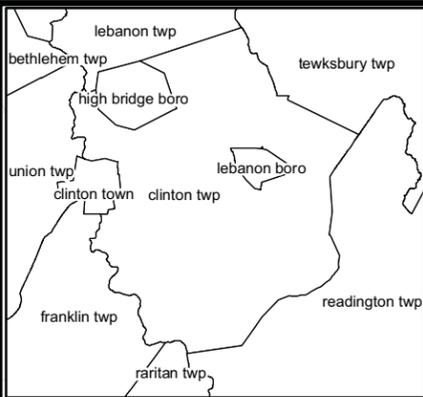

Just as preserved lands provide a variety of benefits, the Highlands Water Protection and Planning Act recognized the importance of the Highlands region of New Jersey as a source of drinking water for millions of residents as well as a repository of critical natural resources. As a result of this legislation, the Highlands Preservation and Planning areas were designated and are depicted on the **Highlands Boundary map**. While the majority of Clinton Township resides in the Planning Area, small portions of the north and west are subject to the restrictions and regulations of the Highlands Preservation Area.

All water courses within the Highlands Preservation Area are subject to 300 foot buffers, and this fact is reflected in the inset map on the **Surface Water Quality Standards map**. This map also shows all streams in the township and categorizes them by their state classification which is indicative of not only designated uses for that water course, but also antidegradation criteria. The buffer restrictions, as outlined in the Stormwater Management Rule (N.J.A.C. 7:8), the Flood Hazard Area Control Act rule (N.J.A.C. 7:13), and the proposed amendments to the Surface Water Quality Standards rule (N.J.A.C. 7:9B), are mapped to visually illustrate which lands adjacent to water courses in the township are subject to development restrictions.

In addition to these rules, current policy implementation in the Highlands Region depends greatly on the location of existing infrastructure as well as service areas. The Inventory includes a map of **Highlands Existing Areas Served** in Clinton Township. This map shows not only the location of current infrastructure installed for the purpose of potable water or sanitary sewer service, but also the region for which these services may be provided.

The provision of the **Day Care & Contaminated Sites map** also improves policy implementation by showing the proximity of day care facilities to known contaminated sites. While each site is further categorized by a remedial level, a more detailed report can be obtained by using the identification number associated with the site.

All of the maps provided in the Natural Resource Inventory are intended for use with the existing Inventory for Clinton Township. For future map updates as well as additional information displays, contact the Upper Raritan Watershed Association.
